

How to fit a Handle Conversion Kit

Description: Handle Conversion Kit
 Models: HS/S, Mk3C & Mk4 Type
 Doors Only

Removing Existing Handle

Remove existing handle by disconnecting the latch cable and drilling out the four rivets securing the handle plate to the front face of the door panel.

Locate one of the new counterplates (Item 1) to the panel aligning the small hole marked 'A' in the plate with the rivet hole in the door panel. Using the counterplate as a template, make two 11mm diameter holes in positions marked 'B'.

Pass the spindle of the handle through the large hole and ensuring the four spigots enter the corresponding holes, trap in position with the additional counterplate on the inside of the door panel and secure with the 4 plastic cups (Item 3) and screws (Item 4).

Attach latch-cable in one of two ways shown adjacent.

When the correct adjustment has been established, secure the plastic crank to the square spindle with starlock washer (Item 6).
